Function

3 Fix Bugs

Fixed Bugs
It fixed the problem of active registration for the English program.
It has updated the judgement condition of photosensor value (Click it to reboot the PTZ, keep the image color if it is color before reboot; keep the image black and white temporarily if the image is black and white. Meanwhile, ICR algorithm is switched according to brightness before PTZ reboot is completed which means before it has successfully acquired ADC value, it will switch ICR if image brightness meets the requirements during the process. It is no longer fixed color or black and white)
